Comments: I note the following concerns.... The mine will have serious negative and irreversible impacts on local ecosystem values and wildlife habitat, in a region that has faced severe ecological collapse from unprecedented fires fuelled by a changing climate. Extensive mature hollow-bearing trees providing critically needed habitat will be lost. The mine will have issues with chemical runoff from tal into headwaters of the Perry River and a local tributary of the Mitchell River threatening downstream water quality and ecology, including the RAMSAR listed Gippsland Lakes. Airbourne pollutions risks nearby food production. The area holds significant GunaiKarnai cultural heritage and value. .
