

Dear Advisory & Committee members, this is to attach to my submission number 96,

I Live within the 2km Red zone of the proposed mine and I am extremely concerned of the noise impact that centrifuges will incur to us all here in our houses and daily life in a very quite rural area.

Kalbar got the amount of water they would need for this mine so wrong how could they possibly be believed that centrifuges will not impact us all in the area, they say our tree line will stop the noise & vibration to us including the birds & wildlife, they have to be joking.

Kalbar have NEVER contacted or spoken to us about the impact that this will have on us, our family home, our lively hood & work place at all EVER. They certainly do not have a social licence in this area as they so often claim as over 900 submissions you have received will certainly testify to that.

How can Kalbar possibly change the EES at the click of a finger without notifying the wider community and to us that we have been under a dirty cloud for 7 years, this has a huge effect on our mental health and wellbeing, Kalbar's EES document that we all spent weeks and weeks reading has so many mistakes and some outright lies, how can we trust this Junior mining company to do the right thing. They just wont and don't

They say the mine will run for 20 years, are we willing to through everything that we have and love in East Gippsland for this short sighted 20 year mine, we have already been impacted for 7 years by them.

We have a fabulous clean green image and our food bowl and beautiful river is sitting right under where this proposed mine will be. How can the noise and disruption to all our lives the centrifuges will create be tolerated.

What hours will they be operated?

How many decibels can a human being take over 20 years on a daily basis?

Can Kalbar be trusted?

Whos doing the reporting of noise levels, can they be trusted?

Who will be accountable for the well being of over 100 people that will be directly effected by this.?

What happens to the wildlife, do they just need to clear out?

What happens to the left over contaminated dry soils?

Can they become airborne?

Centrifuges still need tailings dams,

I guess the question is, Are you willing to risk the the lives, the livelihoods the Agriculture Industry, the Beef and Sheep Industry the health of the River, the fish stocks, the whole of the Waterways of East Gippsland, the Tourism sector, these are all Industries that are sustainable for the next 100 years and beyond, not a mining venture that has a life span of perhaps 20 years at the best.

We simply cannot live with the noise pollution that will 100% affect all of the above, and Kalbar are just full of BS, forever changing the goal posts.

Kind Regards

Sue Banks
